AMENDMENTS TO THE CLAIMS

Please amend claims 1, 9, 12 and 17 as provided below in the Listing of Claims. Please cancel claim 22.

The listing of claims will replace all prior version, and listings, of claims in the application:

## **Listing of Claims:**

(Currently amended) A method for identifying loss of imprinting (LOI) of the IGF2
gene in a subject with colorectal cancer, comprising analyzing a biological sample from the
subject for hypomethylation of a differentially methylated region (DMR) of at least one of the
H19 gene and the IGF2 gene, wherein the biological sample is a blood sample or a colon mucosa
sample; and

detecting hypomethylation of the DMR in the subject, wherein hypomethylation is as compared to the half-methylation of the normally imprinted gene, and wherein further the DMR of the IGF2 gene comprises SEQ ID NO:1, wherein detection of hypomethylation of the DMR in the subject correlates with loss of imprinting (LOI).

- 2. (Canceled)
- (Previously presented) The method of claim 1, wherein the method comprises
  analyzing the biological sample for hypomethylation of a DMR of the H19 gene comprising SEQ
  ID NO:6.
- (Original) The method of claim 1, wherein the method comprises analyzing the biological sample for hypomethylation of both a DMR of the H19 gene and a DMR of the IGF2 gene.

Claims 5-6. (Canceled)

PATENT Attorney Docket No. JHU1900-1

In re Application of: Andrew P. Feinberg Application No.: 10/629,318 Filing Date: July 28, 2003

- (Previously presented) The method of claim 3, wherein the H19 DMR comprises a CTCF binding site, wherein the binding site comprises nucleotides 3010-3172 of SEO ID NO:6.
- (Previously presented) The method of claim 3, wherein the analysis is performed by contacting the biological sample with a primer pair comprising SEQ ID NO:23 and SEQ ID NO:24.
- (Currently amended) The method of claim [[2]]1, wherein the analysis is performed by contacting the biological sample with a primer pair comprising at least one pair of:

SEQ ID NO:2 and SEQ ID NO:3;

SEQ ID NO:4 and SEQ ID NO:5;

SEQ ID NO:27 and SEQ ID NO:28; and

SEQ ID NO:29 and SEQ ID NO:30.

- 10. (Previously presented) A method for identifying an increased risk of developing cancer in a human subject, comprising analyzing a biological sample from the subject for hypomethylation of a differentially methylated region (DMR) of an H19 gene or an IGF2 gene, wherein hypomethylation is as compared to the half-methylation of the normally imprinted gene, and wherein further the DMR of the IGF2 gene comprises SEQ ID NO:1, wherein detection of hypomethylation of the DMR in the subject correlates with loss of imprinting (LOI), and wherein LOI is indicative of increased risk of the subject developing cancer.
  - 11. (Original) The method of claim 10, wherein the cancer is colorectal cancer.
- (Currently amended) The method of claim 10, wherein the method[[s]] comprises bisulfite genomic sequencing performed using the primer pair SEQ ID NO:23 and SEQ ID NO:24, followed by the primer pair SEQ ID NO:25 and SEQ ID NO:26.

In re Application of: Andrew P. Feinberg Application No.: 10/629,318 Filing Date: July 28, 2003 Page 5

- 13. (Original) The method of claim 10, wherein the subject is not a subject known to have a colorectal neoplasm.
- (Previously presented) The method of claim 10, wherein the H19 DMR comprises
   SEQ ID NO:6.
- 15. (Original) The method of claim 10, wherein the method comprises analyzing the biological sample for hypomethylation of a differentially methylated region (DMR) of an H19 gene and an IGF2 gene.
  - 16. (Original) The method of claim 10, wherein the biological sample is a blood sample.
- 17. (Currently amended) A method for identifying an increased risk of developing cancer in a subject, comprising analyzing a first genomic DNA sample from the subject for hypomethylation of [[an IGF2]] a DMR of an IGF2 gene, wherein hypomethylation is as compared to the half-methylation of the normally imprinted gene, and wherein further the DMR of the IGF2 gene comprises SEQ ID NO:1, wherein hypomethylation of the IGF2 gene correlates with the loss of imprinting of the IGF2 gene, and wherein a loss of imprinting of the IGF2 gene is indicative of an increased risk of developing cancer, thereby identifying an increased risk of developing cancer in the subject.
  - 18. (Original) The method of claim 17, wherein the cancer is colorectal cancer.
  - 19. (Canceled)
- (Previously presented) The method of claim 17, further comprising detecting hypomethylation of an H19 DMR comprising SEO ID NO:6.

21. (Withdrawn) A kit for determining a methylation status of a differentially methylated region (DMR) of IGF2 or H19, comprising one or more primer pairs corresponding to one or more of:

SEQ ID NO:2 and SEQ ID NO:3, SEQ ID NO:4 and SEQ ID NO:5, SEQ ID NO:23 and SEQ ID NO:24, SEQ ID NO: 25 and SEQ ID NO:26, SEQ ID NO:27 and SEQ ID NO:28, and SEQ ID NO: 29 and SEQ ID NO:30.

22. (Canceled)
